

Importer Self-Assessment (ISA) with Tradeflow®

Tradeflow® is a web-based logistics software suite designed by Expeditors for use by customers. Tradeflow solutions provide tools to help importers (and exports) gain more control of their global logistics supply chain by providing visibility and data management. Divided into integrated modules, or Centres, Tradeflow facilitates activities such as global product classification, landed cost estimation, compliance management, electronic booking, document creation and distribution and shipment visibility.

Tradewin Collaborative Service with Tradeflow®

By combining the Tradeflow® system and the global trade expertise and knowledge of Tradewin, we are able to provide importers with a comprehensive service for implementing an effective Importer's Self Assessment (ISA) process.

Tradeflow® Supports ISA

Core to the ISA program is the importer displaying reasonable care by using established business practices with defined internal controls designed specifically for their operations. Utilizing Tradeflow's on-line solutions, an importer can implement processes to manage their product effectively, associate their global trading partners, and access current international trade requirements vital to managing an importer's compliance with Customs' regulations.

Tradeflow® Automation and Integration

Tradeflow's open platform allows systematic integration with brokers. This facilitates timely distribution of accurate and consistent data for use at time of entry. Tradeflow subscribers also have the benefit of audit history. With this information, the importer can evaluate the processes and determine, based on their established business performance indicators and controls, if they are compliant.

Tradeflow provides solutions that support your organizations internal control process, a critical success factor to an Importer's Self Assessment initiative. For more information, please contact your local Tradeflow representative.
